

Course Project (85%)

Grading Criteria

Overview:

This will be the main assessment of this unit, which includes three major parts: **Mid-term Presentation**(10%), **Final Presentation**(20%) and **Documents Submission**(55%). The Mid-term presentation will take place during the week of the 01st of June, and the Final Presentation during the last lecture(s). The documents to be submitted should include four essential deliverables, demonstrating the project's usability, project management, user acceptance, reflections, and team collaboration. After the final presentation, there will be a short buffer time for the document submission deadline. The exact dates will be published on Moodle later. Please pay attention to the announcements.

Grade Breakdown:

Mid-term Presentation [10]:

- Presentation quality (structure, delivery, timing, flow).
- Slides quality (readability, clarity, structure)
- Project progress (team roles, project vision, project timeline, architecture, current progress).

Final Presentation [20]:

- Presentation quality (structure, delivery, timing, flow).
- Slides quality (readability, clarity, structure)
- Project work demonstration (team introduction, project vision, project timeline, system structure, current progress, evaluation).
- MVP demonstration (live demo).

Documentation [55]:

0. General evaluation metrics for all the documents:

- Documentation structure
- Content completeness
- Content quality
- Ease of comprehension
- Within page limit

1. User Guide [10]:

2. Project Management Report [20]:

3. User Acceptance Testing Report [10]:

4. Project Safety and Reflection Report [10]:

5. Novelty/Value Proposition [5]:

- Simple wrappers of GenAI APIs will not gain points
- No clones of existing services
- Introduces a new approach, workflow, or combination of methods compared to industry baseline

6. Personal Scale [*0.2 - *1.2]:

- Quality of your peer assessment to others
- Assessment received from your peers

Please evaluate your team members fairly and objectively. Penalties may be applied if we identify any overwhelmingly biased ratings (e.g., all team members performed well-above average).

Acknowledgment of GenAI Usage:

As this course focuses on the usage of GenAI, we encourage you to utilize it as an assistant in your daily tasks. There are no restrictions on the use of GenAI, with appropriate acknowledgment. If you used GenAI in any of the documents for this submission, **please include a section detailing how GenAI was employed during the document's creation.** Since the quality of the document will be accessed, please avoid using GenAI blindly.

What to submit:

0. General Information

Within each group, only one member needs to submit the user guide, project management report, and user acceptance testing report. However, peer reviews must be submitted individually through a Google form.

If the team requests late marking and has not been granted an extension, a late penalty of 10% per working day will apply.

Although all students in a team will usually receive the same mark on group tasks, if there is evidence that the workload distribution in the team is unfair, we may penalize students who do not appear to be pulling their weight.

1. User Guide

It should contain information relevant to end users as to how to use your application and the available features. If your application has multiple roles, each feature should have separate sections.

This document should be visually appealing, short, and to the point. The idea behind this document is that after reading it, the end user should know about your application without running it. Think of it as a pitch for your application embodied within a document.

If you have a landing page, take screenshots and add the link to it within the document.

Main document (exclude title, tables of contents, etc.): up to 5 pages.

2. Project Management Report

It should contain information about how the project is planned and managed by the team. We expect to see the following sections within your project management document:

- **Overall Project Vision:** Define the project scope, including the key deliverables and boundaries of the project.
- **Project Timeline:** Provide a visual timeline with a Gantt chart to identify critical milestones of the project.
 - Project is clustered in categories (task/feature categories, team categories...).
 - There are key subtasks for each category (do not document every possible task).
 - Crew/person responsibilities are clear.
 - The Gantt chart is stand-alone, without needing to read the whole document.
- **System Architecture:** Provide technical details of your project, especially the system's structure and main components.
- **Method:** Elaborate on the methodologies used in your project, including any specific techniques or approaches employed.
 - **Prompt Engineering:** Discuss the prompt engineering strategies used in your project, highlighting how they contributed to the effectiveness of your GenAI applications.
- **Team Chart:** List team members with their specific roles and contributions to the project.
- **Current Progress and Future Plans:** Provide a detailed status update on the current progress of the project, and discuss the future plans for the project completion.
- **Pitch Video:** a ~60s video pitching your project (core use cases/features). This is submitted as an attachment.
 - Frame it as a professional product pitch. State the problem and immediately show how your app solves it.

- Demo the live software and primary user journey. Avoid just showing static slides or code.
- Explain what is happening. Point out GenAI usage, tool calls, and content generation during the demo.
- Ensure high-resolution screen capture (readable text) and a clear, scripted voiceover.

Main document (exclude title, tables of contents, etc.): up to 8 pages.

3. User Acceptance Testing

This plan aims to document the process and the outcome of engaging someone from your target audience to see if your product is solving a problem for them.

Your document should include:

- **[Studying the target user]** A User Case Study outlining the processes, pros, and cons involved in studying your targeted end user with detailed background information on why this particular user was chosen.
- **[Design a user survey]** Document how you are going to study users of your product. Which steps should they take when using your product, and what you consider for evaluation.
- **[Performing a user survey]** Find at least 5 people to join your user survey and collect data to use in your evaluation.
- **[Result analysis and evaluation]** A summary of the execution of the UAT along with the feedback from the user, whether your team is able to incorporate the feedback, and so on.

Main document (exclude title, content, etc.): up to 3 pages.

4. GenAI Safety and Reflection Report

This report aims to provide a comprehensive overview of the safety considerations and reflections on using GenAI in the project. Your document should include:

- **Safety of GenAI:** Discuss the safety considerations taken into account when using GenAI in your project, as well as the strategies you used to mitigate the risks.
- **Lessons learned and reflections:** Reflect on the lessons learned throughout the project through the lens of key deliverables / KPIs / evaluations mentioned in your project vision. Detail what worked well and what could be improved in future projects. Reflect on insights gained and how this project has influenced your understanding of GenAI and its applications.

Main document (exclude title, tables of contents, etc.): up to 3 pages.

5. Peer Assessment Form

This form is for you to rate your team and your experiences throughout the class.
